

Patient Name : **Miss. KARISHMA**
Age/Sex : 9 Yrs / Female
Contact No. : 1234567890
Ref. By. : **Dr. Bharath**

Reg/Lab No. : 26060135 / PR141387
Second Date Of Collection 1 : 17-06-2026 at 12:19 PM
Date of Report : 19-06-2026 at 01:16 PM

TEST PARAMETER	RESULT	UNIT	NORMAL RANGE
IRON PROFILE			
IRON <i>Ferrozine</i>	14.0 (L)	µg/dL	33 - 193
FERRITIN <i>ECLIA</i>	262.3	µg/L	Male : 30- 400 µg/L Female : 13 - 150 µg/L
Total Iron Binding Capacity (TIBC) <i>Calculated</i>	158.5	ug/dL	Children : 100 - 400 µg/dL Adults : 250 - 450 µg/dL
Unsaturated Iron Binding Capacity (UIBC) <i>Ferrozine</i>	144.50	ug/dL	135 - 392
TRANSFERRIN <i>Calculation</i>	110.95 (L)	ug/dL	175 - 320
TRANSFERRIN SATURATION <i>Calculation</i>	8.83 (L)	%	15 - 50

Note:

Iron is an essential trace element which forms an important component of haemoglobin, metallocompounds and Vitamin A. Deficiency of iron, leads to microcytic hypochromic anemia. The toxic effects of iron are deposition of iron in various organs of the body and hemochromatosis.

Total Iron Binding capacity (TIBC) is a direct measure of the protein Transferrin which transports iron from the gut to storage sites in the bone marrow. In iron deficiency anemia, serum iron is reduced and TIBC increases.

Transferrin Saturation is the value of serum iron divided by the total binding capacity of the available transferrin. A low transferrin saturation is a common indicator of iron deficiency anemia whereas a high transferrin saturation may indicate iron overload or hemochromatosis

Transferrin is a transport protein which transfers ferric iron from iron stores to bone marrow. In response to short term iron deficiency, transferrin levels rise markedly to twice the normal levels or higher. Administration of iron to deficient patients increases the saturation followed by return of transferrin to normal level. Simultaneous measurement of transferrin with ferritin helps to differentiate anemia due to iron deficiency and chronic inflammation.

L- Low, H- High
